Claw Assignment By lekhraj jadon

Set up Azure Virtual Machines to host the front-end and back-end services.

1.

- Use two separate Linux VMs (one for the front end, one for the back end).

Set up Azure Virtual Machines to host the front-end and back-end services: Provision two Azure Virtual Machines (VMs) to separate front-end and back-end services. Utilize one VM for hosting the front-end, such as a web server, and another for the back-end, which handles business logic and data processing

ssh -i frontend_public_key.pem azureuser@52.149.234.232

1. **Dockerize the front-end and back-end applications**.
2.
    - The front-end can be a simple NGINX server hosting a static HTML page.
    - The back-end can be a Node.js API.

Dockerize the front-end and back-end applications: Dockerizing applications involves encapsulating them into containers, which simplifies deployment and scaling. For the front-end, use an NGINX container to serve static HTML pages efficiently. For the back-end, deploy a Node.js container to manage API requests, ensuring that both services run in isolated environments with consistent configurations across different systems.

docker build -t frontend-image .

docker run -d -p 80:80 frontend-image

docker run -d -p 80:80 frontend-image

docker build -t backend-image .

docker run -d -p 8000:8000 backend-image

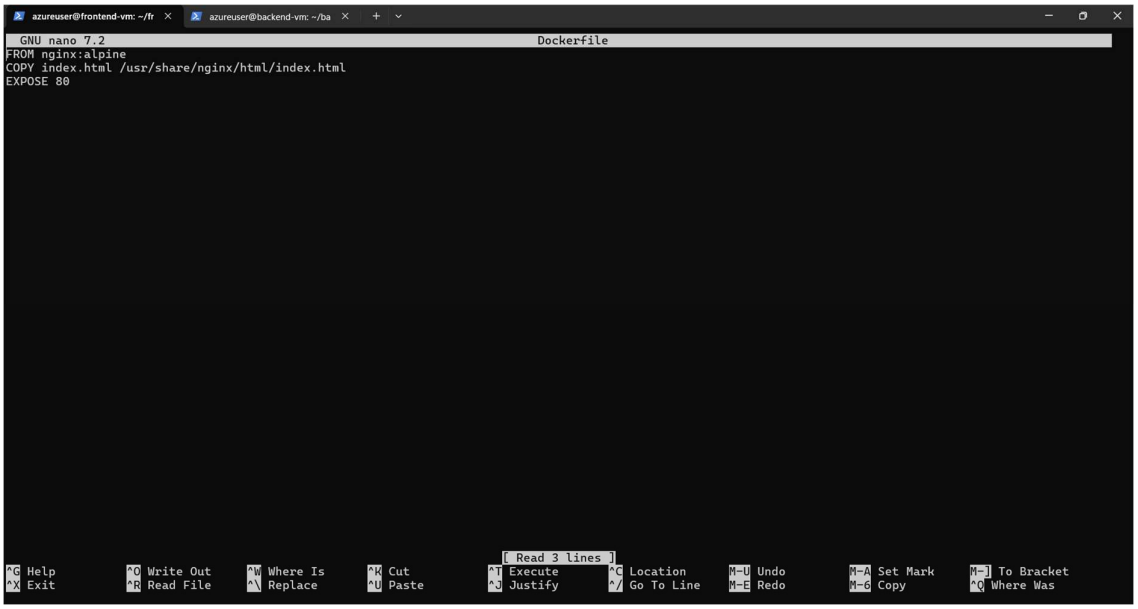
Docker File For INGINX



I believe I am a strong fit for the Cloud Engineer role due to my hands-on experience with Azure and AWS, where I've work on cloud environments and Active Directory. My internships have provided me with a deep understanding of cloud security and infrastructure management. Additionally, my commitment to continuous learning, evidenced by my pursuit of the Azure Administrator Associate certification

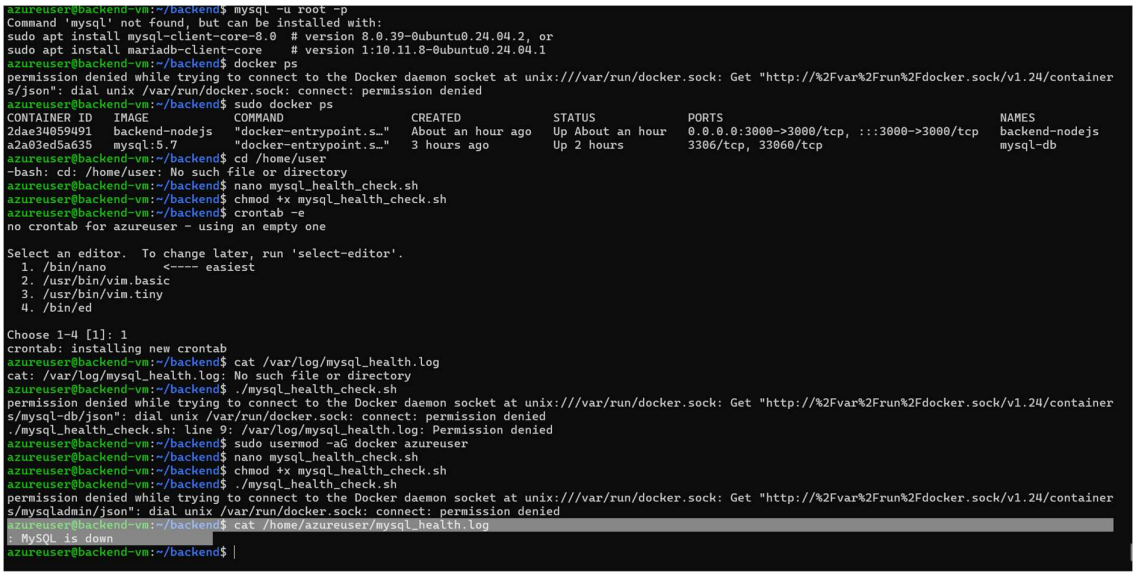
1. **Deploy a MySQL database** using Docker on the back-end VM.

Deploy a MySQL database using Docker on the back-end VM: Deploying MySQL in a Docker container on the back-end VM isolates the database from the host environment, enhancing portability and ease of management. This approach allows for quick deployments and version control while maintaining a consistent database environment across development, testing, and production stages.

docker pull mysql:latest

docker run -d -p 3306:3306 --name mysql-db -e MYSQL_ROOT_PASSWORD=<password> mysql:latest



```
azureuser@backend-vm:~/backend$ docker ps
permission denied while trying to connect to the Docker daemon socket at unix:///var/run/docker.sock: Get "http://%2Fvar%2Frun%2Fdocker.sock/v1.24/containers/json": dial unix /var/run/docker.sock: connect: permission denied

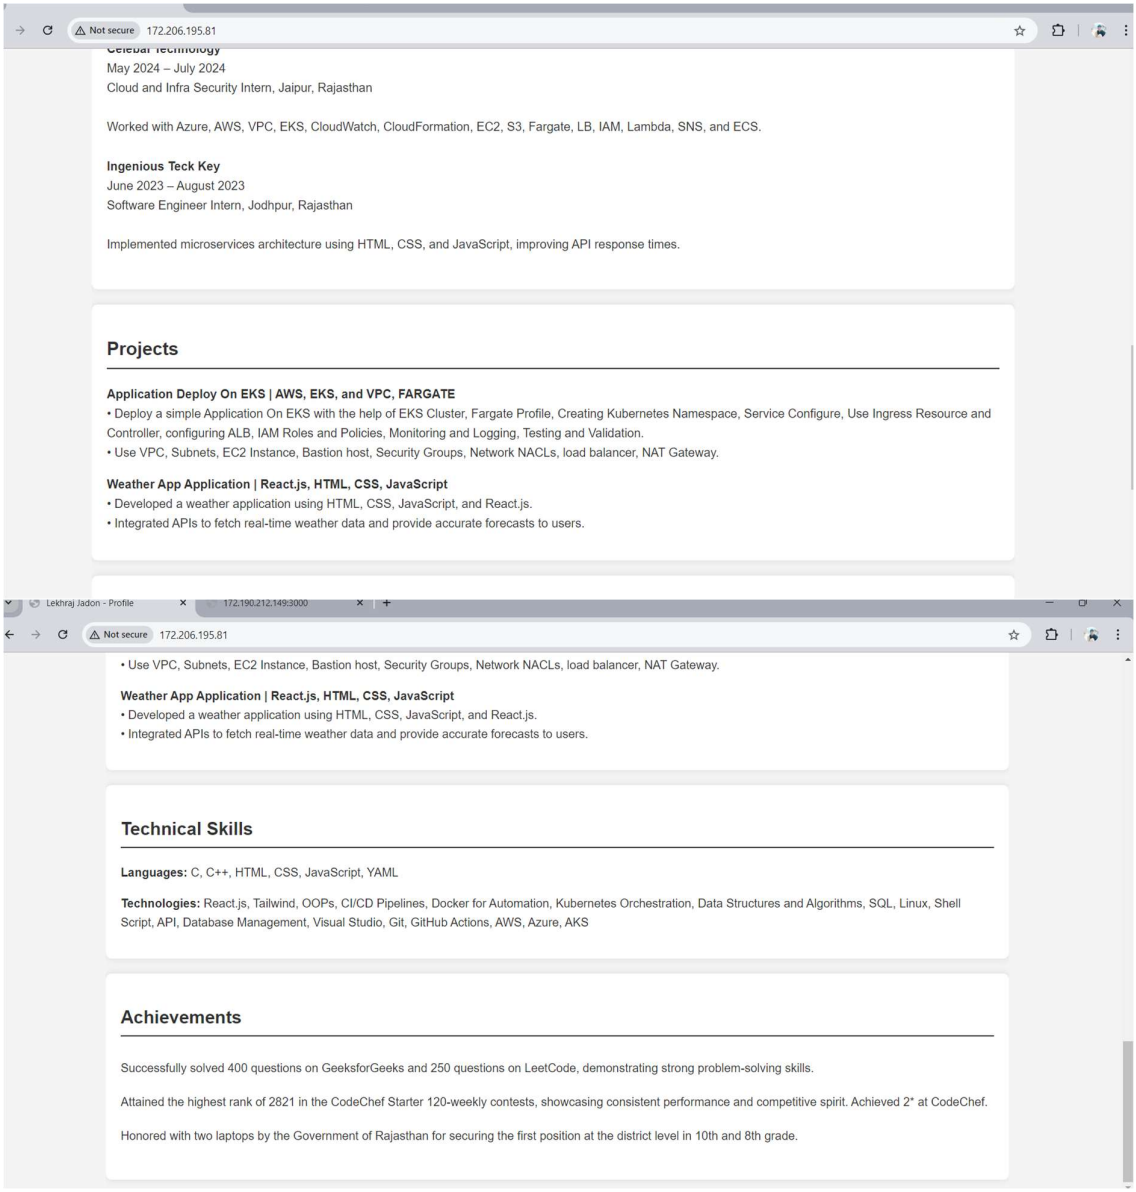
2020, RBSE
Vikas Bal Vidhyapeeth Sr Sec School Deeg, Bharatpur
Score: 93.80%
Experience
Bm Infotrade Private Limited
July 2024 – Present
Cloud Engineer Intern, Jaipur, Rajasthan
Worked on Azure, AWS, AD-DS, DNS, IAM, ACS, OUs, GPO, Docker, AKS, EKS, Kubernetes, Cloud Storage (Blobs, File Share), App Services, VMs, VMSS, Monitoring, Backup Recovery, and Automation.
Utilized DevOps tools and technologies such as CI/CD pipelines, Jenkins, Git, GitLab, and Docker for automated deployments and integration.
Provided technical support to employees and handled new cases via phone, email, and web.
Maintained communication with remote and local teams.
Managed cases per Service Level Agreements (SLA), ensuring high customer satisfaction.



1. **Ensure database integration** between the back-end API and the MySQL database, securing communication using SSL.

2. • **Ensure database integration between the back-end API and the MySQL database, securing communication using SSL:** Integrate the Node.js API with the MySQL database by configuring the database connection within the API code. Implement SSL/TLS to encrypt data transmitted between the API and the database, ensuring secure data communication and protecting sensitive information from interception and tampering.

   Mkdir my.cnf
   [mysqld]

```
ssl-ca=/path/to/ca-cert.pem
ssl-cert=/path/to/server-cert.pem
ssl-key=/path/to/server-key.pem

update node.js
const mysql = require('mysql');
const connection = mysql.createConnection({
  host: 'localhost',
  user: 'root',
  password: '<password>',
  database: '<database>',
  ssl: {
    ca: fs.readFileSync('/path/to/ca-cert.pem')
  }
});
```

I believe I am a strong fit for the Cloud Engineer role due to my hands-on experience with Azure and AWS, where I've work on  cloud environments and Active
Directory. My internships have provided me with a deep understanding of cloud security and infrastructure management. Additionally, my commitment to continu
ous learning, evidenced by my pursuit of the Azure Administrator Associate certificationazureuser@backend-vm:~/backend$
```

1. Set up **Azure Load Balancer** to distribute traffic between the front-end and back-end VMs for high availability.

Set up Azure Load Balancer to distribute traffic between the front-end and back-end VMs for high availability: Configure Azure Load Balancer to distribute incoming traffic evenly between the front-end and back-end VMs. This setup enhances application availability and reliability by balancing the load, preventing any single VM from becoming a bottleneck, and ensuring uninterrupted service in case of VM failures.

A load balancer rule is used to define how incoming traffic is distributed to the all the instances within the backend pool.
A load-balancing rule maps a given frontend IP configuration and port to multiple backend IP addresses and ports. An example would be a rule created on port 80 to load balance web traffic. Learn more.

48.216.132.22
Apache2 Default Page
Ubuntu
It works!
This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should replace this file (located at /var/www/html/index.html) before continuing to operate your HTTP server.
If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.
Configuration Overview
Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is fully documented in /usr/share/doc/apache2/README.Debian.gz. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the manual if the apache2-doc package was installed on this server.
The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:
/etc/apache2/
|-- apache2.conf
| `-- ports.conf
|-- mods-enabled
| |-- *.load
| `-- *.conf
|-- conf-enabled
| `-- *.conf
|-- sites-enabled
| `-- *.conf

Ubuntu

Apache2 Default Page

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

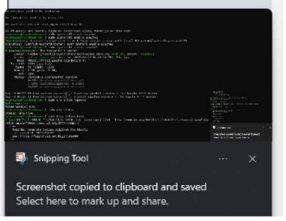
If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

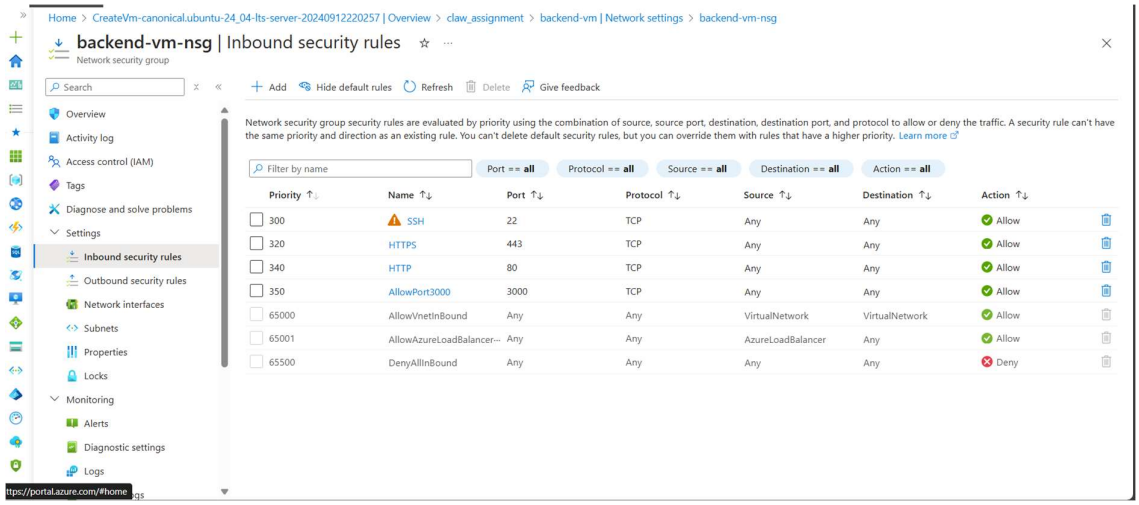
Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in /usr/share/doc/apache2/README.Debian.gz**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

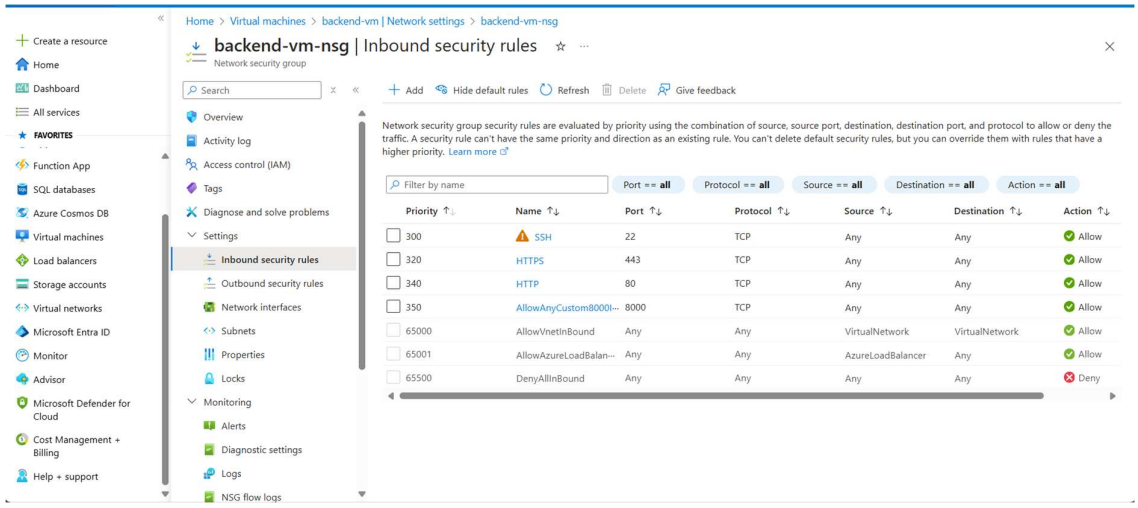
The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|       `--  ports.conf
|-- mods-enabled
|       |-- *.load
|       `-- *.conf
|-- conf-enabled
|       `-- *.conf
|-- sites-enabled
|       `-- *.conf
```



1. Implement **Azure Security Center and Network Security Groups** (NSGs) to protect against external threats. Ensure only necessary ports (e.g., 80/443) are open to the public.





1. Configure a **cron job** on the back-end VM to perform a health check on the database and log the status every 10 minutes.

onfigure a cron job on the back-end VM to perform a health check on the database and log the status every 10 minutes: Set up a cron job on the back-end VM to periodically execute a script that performs health checks on the MySQL database. This job logs the database status every 10 minutes, helping detect and address issues promptly, ensuring database availability, and maintaining application performance.

crontab -e

*/10 * * * * /usr/bin/python3 /path/to/health_check_script.py >> /path/to/health_check.log 2>&1

# Edit this file to introduce tasks to be run by cron.
#
# Each task to run has to be defined through a single line
# indicating with different fields when the task will be run
# and what command to run for the task
#
# To define the time you can provide concrete values for
# minute (m), hour (h), day of month (dom), month (mon),
# and day of week (dow) or use '*' in these fields (for 'any').
#
# Notice that tasks will be started based on the cron's system
# daemon's notion of time and timezones.
#
# Output of the crontab jobs (including errors) is sent through
# email to the user the crontab file belongs to (unless redirected).
#
# For example, you can run a backup of all your user accounts
# at 5 a.m every week with:
# 0 5 * * 1 tar -zcf /var/backups/home.tgz /home/
#
# For more information see the manual pages of crontab(5) and cron(8)
#
# m h  dom mon dow   command

1. **Optimize VM sizing** for cost-effectiveness and performance by evaluating CPU, memory, and network usage.

Optimize VM sizing for cost-effectiveness and performance by evaluating CPU, memory, and network usage: Regularly review the resource utilization of your VMs to balance performance and cost. Analyze CPU, memory, and network usage to determine if the current VM sizes are appropriate. Adjust the VM sizes based on the actual workload to optimize both cost and performance, ensuring efficient use of resources while keeping operational costs manageable.
